4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **japanesewithavnish.com** for a **EdTech / SaaS — Japanese learning (JLPT N5–N1), content-type deep dive** site, generated on August 08, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

54/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** The site is 78% vocabulary pages, and 88% of them (4,613 of 5,224) have no example sentences — thin content at massive scale.
2. **Info:** Content-generation scripts never populate `seo_title/seo_description`, so ~90% of learn pages fall back to the bare page title as their meta description (vocab desc = 'と き ど き', kanji = '尻 - butt').
3. **Info:** No structured data on any learn/study-guide/JLPT/curriculum page — only the site-wide Organization block. ArticleSchema exists but only `blog/[slug]` uses it.
4. **Info:** 0 of 8,935 learn posts have an author — no E-E-A-T authorship on a person-branded education site.
5. **Info:** ~2,250 pages (incl. 1,833 kanji) are written but sitting in draft — a large produced asset not yet earning traffic.

Quick Wins:

1. Add the summary fallback to learn-detail descriptions (`LearnDetailContent.tsx:104`) — one line, ~6,000 pages.
2. Add BreadcrumbList schema (visual breadcrumbs already exist site-wide).
3. Reuse existing ArticleSchema on study guides and learn detail pages.
4. Add `/learn/kana*`, `/learn/curriculum`, `/scoreboard`, and `JLPT ?level` variants to the sitemap.
5. Fix category canonical to drop the default `sort=newest` param (`[type]/page.tsx:82`).

2. Audit Categories

2.1 Vocabulary (5,229 pages, 78% of site)

Score: **42/100**

What Works

- Fully crawlable (always_free)
- Correct percent-encoded canonicals for Japanese slugs
- Excellent internal linking (breadcrumb + related-lessons)
- ISR (revalidate=60)

Findings

88% of vocabulary pages have no example sentences **High**

DB: 4,613 of 5,224 published vocab items have zero examples; 4,611 have no examples and no notes. They render as word + reading + meaning only (~50-80 words). The 12% with examples average 6 good sentences.

Recommendation: Generate/curate 3-6 example sentences (JA+romaji+EN) per word using the existing examples table + template. Highest content ROI on the site.

Stub meta descriptions on 93% of vocab pages **High**

Only 363/5,229 have seo_description; the rest fall back to the word itself. LearnDetailContent.tsx:104.

Recommendation: Backfill seo_description from word/reading/meaning; add summary fallback immediately.

No structured data **High**

Only Organization schema renders. No DefinedTerm/LearningResource/BreadcrumbList.

Recommendation: Add DefinedTerm + BreadcrumbList.

2.2 Kanji (423 published / 1,833 draft)

Score: **58/100**

What Works

- Best-templated learn type: consistent ~845-char bodies with readings, stroke count, frequency, grade, stroke-order data

Findings

1,833 kanji stuck in draft **High**

4x the live count is written but unpublished.

Recommendation: QA and publish in batches with seo_description populated; ~5x the kanji corpus.

72% missing seo_description; no schema; 5% have examples **Medium**

120/423 have seo_description; only 117/2,186 items have examples.

Recommendation: Backfill descriptions; add DefinedTerm schema; add example words.

2.3 Grammar (560 pages)

Score: **52/100**

What Works

- 67% have example sentences (best coverage of structured types)
- Strong category-page metadata

Findings

Thinnest bodies on the site (avg 145 chars, 54% under 200) **High**

303/560 grammar pages have bodies under 200 chars — too thin for a high-intent JLPT category.

Recommendation: Expand each with explanation, structure breakdown, when_to_use notes (column exists), common mistakes, and examples.

No schema **Medium**

No LearningResource/BreadcrumbList.

Recommendation: Add schema.

2.4 Study guides (392 pages)

Score: **55/100**

What Works

- Genuinely rich, structured content (avg 1,451 chars; richer via lesson_blocks)
- Strongest AI-citation asset on the site

Findings

Good content, broken packaging **High**

Renders via LearnDetailContent so emits NO Article schema (unlike /blog/[slug]); 0/392 have OG images; only 25% have seo_description (title-stub descriptions); no author/date.

Recommendation: Add Article schema, OG images, real descriptions, author/date. Highest-leverage GEO win.

2.5 Blog (21 editorial posts)

Score: **82/100**

What Works

- Reference implementation: full metadata, Article+Person+ImageObject schema, author fallback, dates, related posts, og:type=article
- All 21 have seo_description + OG images
- Authentic first-person E-E-A-T

Findings

Low volume + missing dateModified/BreadcrumbList **Medium**

Only 21 posts across 6 categories; schema lacks dateModified though updated_at exists; author Person is name-only.

Recommendation: Build a content pipeline; add dateModified + BreadcrumbList; enrich author with url/sameAs.

2.6 JLPT level pages (N5-N1)

Score: **60/100**

What Works

- Unique title/description per level
- Self-referencing canonical per level
- High commercial intent

Findings

No Course schema; N4-N1 not in sitemap; client-rendered **Medium**

JLPTContent is a client component so only the requested level's HTML is crawlable; sitemap lists only bare /jlpt.

Recommendation: Add Course/ItemList schema; sitemap all level variants. Do NOT add FAQPage for rich results (retired May 2026); keep FAQ as on-page/GEO content.

2.7 Curriculum (432 lessons)

Score: **48/100**

What Works

- Strong taxonomy: 5 levels / 54 modules / 96 submodules / 432 lessons

Findings

Large asset neither indexed nor clearly gated **Medium**

Individual lessons are personalized/gated and not in sitemap; hub is client-rendered with thin SSR; title lacks brand suffix; no Course schema.

Recommendation: Decide indexation strategy: server-render a crawlable free-preview outline + Course schema + sitemap, or keep fully premium.

2.8 Reading / Listening / Writing / Sounds / Kana

Score: **57/100**

What Works

- Healthy bodies (sounds ~2,000 chars); listening has audio+transcript+questions SSR'd
- Most have seo_description

Findings

No schema; low volume; kana practice pages thin in SSR + missing canonicals **Medium**

Kana practice pages (hiragana/katakana/kanji) are client-rendered, lack canonicals, and are absent from the sitemap despite high search volume. 29 listening drafts unpublished.

Recommendation: Add canonicals + sitemap entries + server-rendered content for kana pages; add AudioObject/LearningResource schema; publish listening drafts.

2.9 Rewards / XP / Gamification

Score: **50/100**

What Works

- Rich system: 102 badges, 9 achievements, streaks, monthly leaderboard reward engine

Findings

Rich system with almost no indexable surface **Medium**

Dashboard/badge pages are login-gated; the 100-badge catalog is never exposed; /scoreboard is public but client-only and not in the sitemap; guide sections are seeded published=false (a re-seed would unpublish the live explainers).

Recommendation: Publish + harden guide sections; server-render /scoreboard top-N and sitemap it (privacy via show_on_scoreboard opt-in); build a public /badges catalog page.

2.10 Cross-cutting: metadata & schema pipeline

Score: **45/100**

What Works

- Shared seo.ts helpers (clampTitle/clampDescription/canonicalUrl)
- metadataBase set correctly
- All content server-rendered and crawlable

Findings

Generation scripts never write seo_title/seo_description **High**

scripts/generate-*.ts insert content/summary/og_image but not SEO metadata, so descriptions default to title (learn) or formulaic summary (blog).

Recommendation: Update generators to set seo fields + one-off backfill of the existing corpus.

Inconsistent description fallback chains **Medium**

Blog: seo_description||summary||title. Learn: seo_description||title (no summary). Guide: short_description only (no clamp/fallback).

Recommendation: Unify on seo_description||summary||built-description||title and always clamp.

3. Action Plan

Phase 1: High-leverage code fixes Week 1

- Add summary fallback to learn-detail descriptions (LearnDetailContent.tsx:104)
- Add BreadcrumbList schema site-wide
- Add Article/LearningResource schema to study guides + learn detail
- Add dateModified to Article schema
- Fix category canonical default-sort pollution ([type]/page.tsx:82)
- Add missing canonicals (kana pages) + brand title (curriculum)
- Fix sitemap coverage (kana, curriculum, scoreboard, JLPT variants)

Phase 2: Populate SEO metadata at scale Weeks 2-4

- Backfill seo_description + seo_title from structured fields (~6,000 pages)
- Update generation scripts to set SEO columns going forward
- Generate + backfill OG images per content type

Phase 3: Content depth Month 2+

- Raise vocabulary example-sentence coverage from 12% toward full (biggest ROI)
- Deepen grammar explanations (560 pages)
- Publish the 1,833-kanji draft backlog with QA
- Establish authorship/E-E-A-T: /about + bylines + Person schema + Organization sameAs/logo

Phase 4: Structural opportunities Ongoing

- JLPT: add Course schema + sitemap level variants
- Curriculum: decide + implement indexation strategy
- Rewards: publish guide sections, server-render + sitemap /scoreboard, build public /badges catalog
- Grow reading/listening/writing/sounds; publish listening drafts

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)
